

How to Think.

**What is an
argument?**

Answers the 3 Questions

What is the status quo?

- **Claim**
- **Warrant**
- **Data**

How does the bill/policy change the status quo?

- Claim
- **Warrant**
- Data

Why should we care?

- CWDI

Different types of logic

Deductive reasoning - two premises and a conclusion

- EX: If all men are mortal and Socrates is a man, then Socrates is a mortal

Inductive reasoning - making an inference, specific observations to make a general conclusion

- EX: Precedent, if this happened in the past, u can assume it'll happen in the future

Abductive reasoning - best guess of the outcome

- Drawing conclusions based on evidence/events
- An outcome is PROBABLE but not guaranteed

Logic in a Congress Argument

Your warrant is usually deductive

- If this is the status quo and this is what the bill does, then this outcome is true

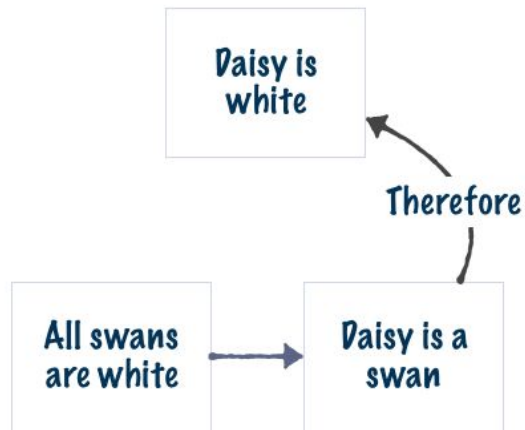

Your data is usually inductive

- We can infer from past precedent or a study of past events

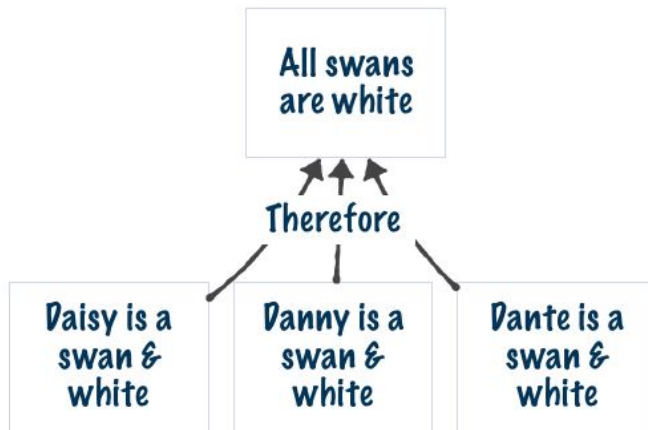

Your impact is usually abductive

- We make a best guess at what happens when you pass a bill

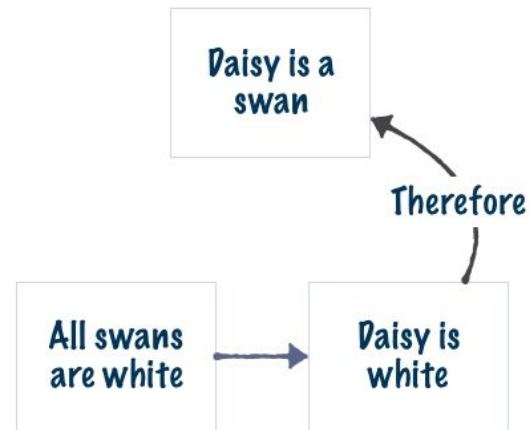

DEDUCTION

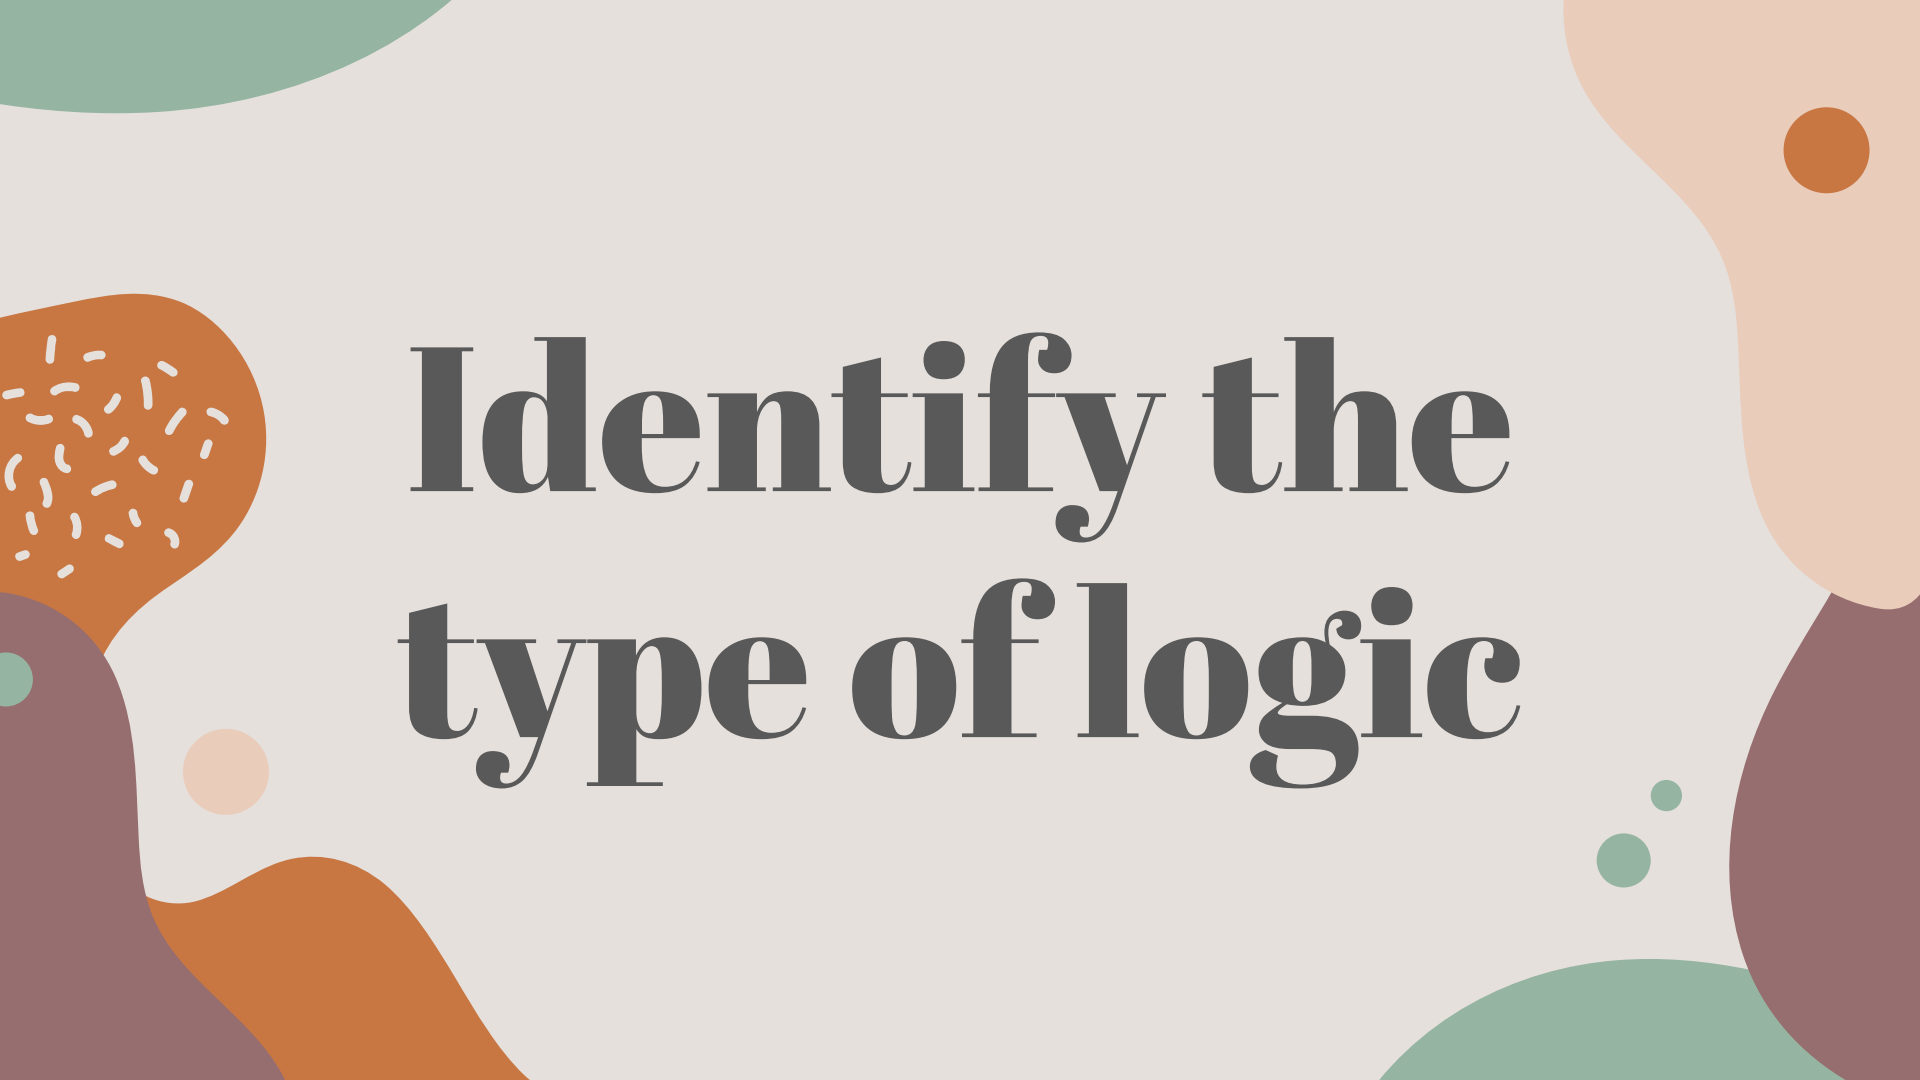

INDUCTION

ABDUCTION

**Identify the
type of logic**

IDENTIFY!

China's economy is hurt by sanctions, so they'll comply with its terms to remove them.

The last time we placed sanctions on China's economy, they reduced their human rights abuses.

Sanctions hurt weak governments and China's economy is weak, therefore China's economy is hurt by sanctions.

Your Turn!

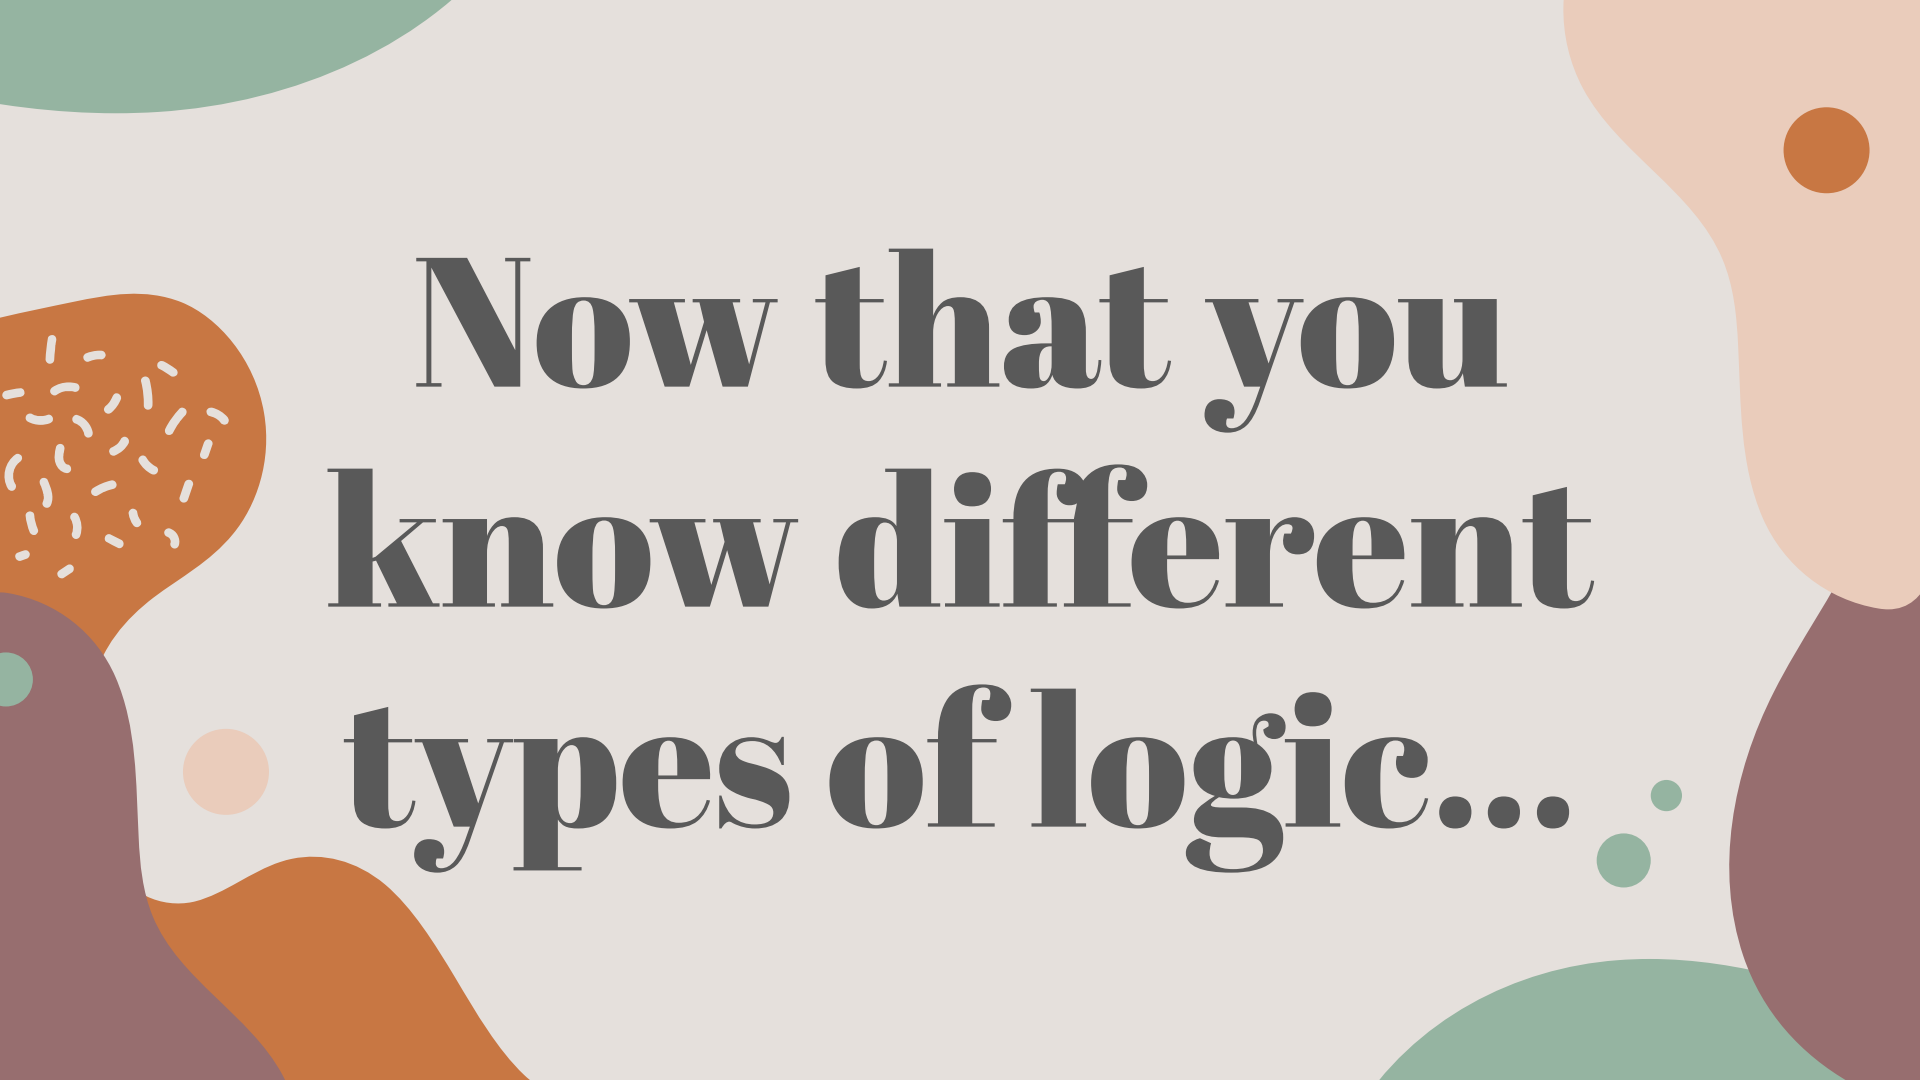

Come up with an argument in favor of implementing Universal Basic Income using different types of logical reasoning

- In other words, what will logically happen when we implement Universal Basic Income?

Deductive

Inductive

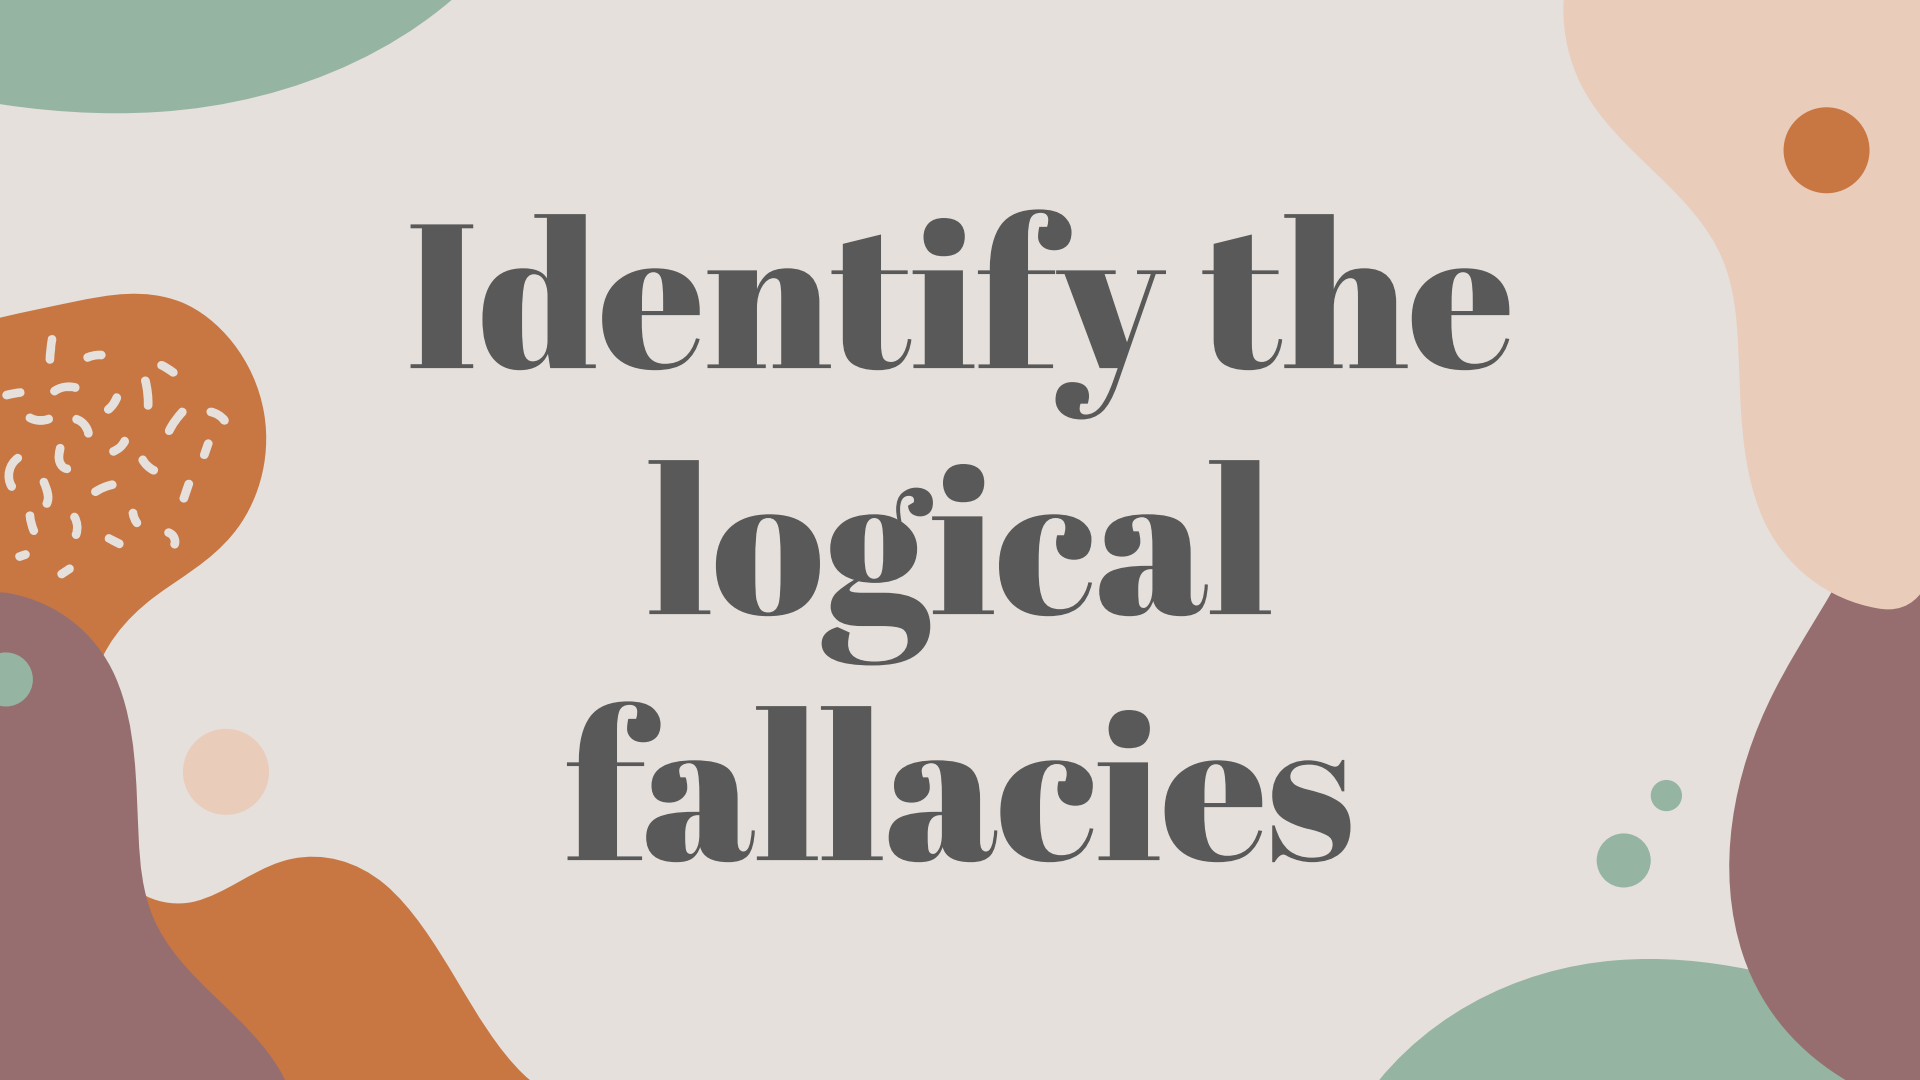

Abductive

**Now that you
know different
types of logic...**

LOGICAL FALLACIES

- Deductive reasoning
 - if the premises are untrue OR if the premises don't lead to the conclusion
- Inductive reasoning
 - If the circumstances that you're making an inference from are different than the circumstances now
- Abductive reasoning
 - Disproving the known information that the person is drawing the conclusion from

Identify the logical fallacies

IDENTIFY!

Deductive - Sanctions hurt weak governments and China's economy is weak, therefore China's economy is hurt by sanctions.

Inductive - The last time we placed sanctions on China's economy, they reduced their human rights abuses.

Abductive - China's economy is hurt by sanctions, so they'll comply with its terms to remove them.

**This is useful for
both refuting
and
questioning!**

Questioning Round Strategy

types of questions and when you do them

- Set-up cross
 - Done before you speak
 - Can use this for refutation material in your speech
 - EX: A bill to ban charter schools --- Within a neg point about how charter schools boost test scores, providing a viable alternative to zoned, underfunded public schools -- "Sen ___ agreed in questioning that discipline at zoned schools in underfunded districts can be just as strict as charter schools. Since it's the case that both schools are strict in their discipline, I'd argue it's worth keeping the one that actually shows us educational outcomes. "
 - **What does the questioning block look like for this refutation to be possible?**
 - You can introduce your point/hint at your point's logic in the question as well

types of questions and when you do them

- Attacking cross -- attacking logical fallacies
 - Can go before or after your speech
 - Fox Strategy
 - A series of short, yes/no questions that gets them to admit them that they don't make sense
 - Some ppl choose no instead of yes to avoid the trap
 - To combat, write a question that reroutes line of questioning back to where you want it to be OR have diff line of questioning as a backup
 - Bear Strategy
 - Start off with the hard-hitting question
 - Take apart their refutation or advance your point
 - Relies on back and forth and that ur argument still stands

types of questions and when you do them

- Reinforcing cross -- Tie ur own argument to ur opponents argument
 - Primarily after you speak to help with your relevance or to combat refutation
 - This can look like giving a weighing mechanism where urs is obviously more true
 - EX: "whats more impo, a few more dollars or saving our dying planet" -- Bear strategy, then you spend the rest of the block reaffirming your logic
 - If you get this question, challenge their characterization of ur point

Planting Seeds of Doubt

- Evidence - look up what they say while their saying it so ur not taken aback
- Getting them to stand on their own and not with their side if they majorly disagree w a common agreement on their side
- Get them to admit they're denouncing other members on their side - bad for them perceptually
- Get them to admit their misconstruing u if they do that when their reffing u

General Advice

- 3-4 questions w direct, space them out
- Save precedence to question someone rlly good but also risky bc u might not have a question
- Don't kick a horse that's down
- If u get the first question, sometimes POs wont pick u up for the speech u give right after
 - Don't question too much in first two cycles

Answering Questions

General Advice

- Always have an answer with confidence, even if u dont believe it
- Instead of answering yes or no, say why u disagree with the way they put it
- Reaffirming ur logic is good when judges arent listening
 - but if they are, it looks like ur dodging the question
- Fall back on ur own impacts, but explain why these impacts are more important than what ppl asking are talking about
- Predict common questions beforehand and be ready to defend
